

Nitrous System

I know what your thinking,"Are you sure i can put nitrous on my car?? Ive never seen it done on a family car!". The answer is yes.

The only thing you have to worry about is how much to put. In the case of the 60° V-6, the pistons are weak from the factory and will only safely support about a 50hp increase. Anything over that, and you should consider upgrading to aftermarket Hyperutectic or ForgedPistons. After that, you can safely go with whatever your transmission will hold. Probably up to 120hp increase.

This is the kit that you would use, an EFI kit. This kit uses the vehicles existing fuel system to deliver the extra fuel needed. This system uses one injection nozzle screwed up through the airhose in front of the throttle body. It also uses a microswitch that only kicks in the juice at full throttle so that the computer uses it in an open-loop mode so that you get trouble free horsepower.

Other Nitrous systems are available, from NOS, Nitrousworks, Compucar, and a few others, but NOS is the only one i know of with a website.

Here is a great site that show's the install of a NOS kit for a Fiero 2.8. Most of this applies to all 60° cars, so check it out!
